ISSUE : [Issue 11](#)

Published by Ronald Caplan on 1975/6/1

The hay truck is essentially a long set of trams • straight except for the curve where the horse goes between the shafts. The big timbers are usually cut from a single stick of wood that, already has the necessary curve. Between the timbers are rough boards, widely spaced. A stick goes upright into holes bored at the four corners of the truck, and the sides are made of two sticks and two boards. Enormous loads of hay can be transported if it is forked on properly • building up first at the corner-sticks and sides, tramping the load often and forking the hay to the front and rear to keep a balanced load.
