Earle Embree: Now here's my father sitting "on the coupling of the shimter engine at " the Point Tupper roundhouse door. They tore the roundhouse down. The gypsum pile is sitting pretty much on the roundhouse now. The shunter's the engine that made up the trains before the engine that took them to Sydney was hooked on. And that en? gine was also used to put the cars onto the Scotia and take them off of the Scotia. The shunter would push them on. There were 3 flat cars behind the shunter, so that she didn't get out on the main part of the apron. Normally, the Scotia took 18 cars strung the full length of her in three rows. She'd take 18 boxcars or 18 cars of coal or 9 passenger cars. At one time. And if there were any more than that, which there seldom were, she'd have to make an? other trip. But you take a train today with 125 to 130 cars on • how many trips would the Scotia have to make to get a train across the strait?
