Farmers can avoid loss and inconvenience by installing a standby power generator. Why? During a power interruption, to provide electric power to critical equipment for the protection of livestock, poultry and essential farm operations. What type? The system you require will depend on power. Your Electrical Department may be installed in a Electrical Contractor, the Nova Scotia Department of Agriculture Extension Engineer and the N.S. Power Corporation can assist you in selecting the equipment and warning system best suited to your needs. Installation! A standby generator can be installed in a building or on a pad. It can be on a trailer, or have a drawbar attachment for moving about as a power supply for field repair jobs. The generator may be driven by a tractor or by its own engine. Your electrical contractor is required to comply with existing Provincial requirements for the protection of lives and property. An electrical wiring permit and inspection is required for all new installations of standby power generators. If you already have an installation located within our inspection areas, N.S. Power Corporation will check it over without charge, to be satisfied that it is safe for you and for us: Safety! A standby system, improperly wired and installed, can cause injury and death to equipment. Your electrical contractor may find useful information regarding farm load calculations and correct wiring methods in our "Electrical Inspection 1 1-1975", available upon request. When? Now is a good time to give your farm the benefit of a standby generator installed, your livestock, poultry and buildings will be protected during power interruptions. Property insurance premiums are usually reduced on farms having standby generators. Ask us about the advantages of a standby generator. In person, by telephone, or by letter.
